Märkusi 1935. aasta kohta.

Meteoroloogia Observatooriumi vaatlused on toimetatud samade mõõtmisriistadega ja sama kava järgi nagu eelmiselgi aastal.

Observatooriumi kaastööliste koosseisu kuulusid 1935. aastal: inspektor — A. Kärnsa; teaduslik ametnik — H. Liidemaa; vanem assistent — E. Maanvere; abiassistendid — K. Sule (kuni 15. VI) ja L. Prants (alates 16. VI); sünoptikud — A. Nurklik ja A. Ohu; vaatlejad — J. Kukk ja J. Luhari; kantseleiametnikud — T. Raielo ja H. Lokko.

Käesolevas aastaraamatus avaldatud vaatlusandmed on kontrollitud H. Liidemaa ja allakirjutanu poolt.

K. Kirde

Meteoroloogia Observatooriumi juhataja.

Notes for the Year 1935.

The meteorological observations were made with the same instruments and in the same way as in the previous year.

The staff of the Observatory consisted of the following officials: inspector — A. Kirsna; scientific collaborator — H. Liidemaa; chief-assistent — E. Maanvere; subassistents — K. Sule (till 15. VI) and L. Prants (from 16. VI); forecasters — A. Nurklik and A. Ohu; observers — J. Kukk and J. Luhari; clerks — T. Raielo and H. Lokko.

The observations were controlled by H. Liidemaa and the undersigned.

K. Kirde

Director of the Meteorological Observatory.

Märkusi II-järgu jaamade kohta 1935. a.

Kõigis II-järgu meteoroloogiajaamades toimetati vaatlusi samatüübiliste vaatlusinstrumentidega ühise kava järele nagu eelmistel aastatel.

Vaatluste tähtaegadel mõõdeti õhurõhumist kaussbaromeetriga kuna õhurõhumise käiku registreerisid barograafid. Psühromeetrid, äärmustermomeetrid, juushügromeetrid ja termograafid asetsesid inglisonnides. Tuule suuna ja kiiruse mõõtmiseks tarvitati Wild'i süsteemi tuulelippe. Sademeid mõõdeti sademetemõõtajatega, püüdepinnaga 500 sm², mis varustatud tuulekaitsjatega. Pääle ülalmainitud instrumentide olid jaamades päikesepaiste isemärkijatena tarvitusel Weličko süsteemi heliograafid.

Kõigis jaamades toimetati vaatlusi keskmise kohaliku aja järele kell 7, 13 ja 21. Sademete hulk iga päeva kohta on antud millimeetrites hommiku kella 7-st järgneva päeva kella 7-ni.

Avaldatud vaatlusandmeis on arvestatud vastavaid instrumentaaliõiendusi ning õhurõhumise andmeis veel temperatuuri- ja raskustungiõiendusi.

Vaatlusandmed on avaldatud 25 jaamast, mille konstantarvud on tabelis lk. 95.

Vaatlusandmete läbitöötamist toimetasid Observatooriumi ametnikud T. Raielo ja H. Lokko. Jaamade revideerimist koha peal, vaatlusriistade võrdlemist ja vaatlusandmete kontrollimist teostasid Observatooriumi inspektor A. Kärnsa ja allakirjutanu.

K. Kirde

Met. Observatooriumi juhataja.

Notes to the Stations of Second Order.

At all the meteorological stations of second order the observations were made with the same instruments and according to the same instructions as in the previous year.

The pressure was taken with the mercury barometers, whereas the variations of pressure were recorded by means of barographs.

The hygrometers, extreme thermometers, and thermographs were placed in psychrometric screens. For the recording of wind directions and velocity the wind-vanes of Wild were used. The precipitations were measured by rain-gauges of 500 cm² receiving surface at a height of 2 m protected by Nipher type shields of funnel shape. Except the above mentioned instruments the stations were provided with Welitchko sunshine recorders.

At all the stations the observations were made at 7^h, 13^h and 21^h mean local time. The daily amount of precipitations from 7^h till 7^h of the next day is given in mm.

The instrumental correction has been taken into consideration in all the observations; for those of pressure — also the corrections of temperature and gravity.

This book contains the observations of 25 stations.

The data have been worked out by the employees T. Raielo and H. Lokko. The revision of the stations as well as the control of the observations was done by Inspector A. Kärсна and the undersigned.

K. Kirde

Director of the Observatory at Tartu.

Märkusi sademete-, äikese- ja lumevaatluste kohta.

Sademete-, äikese- ja lumevaatlusi toimetati pääle II-järgu jaamade veel alamajärgulistes ilmajaamades ja vaatluskohtades, kokku 170 kohas. Pääle selle märgiti mõnes vaatluskohas veel sisevete kinnikülmumist ja lahtiminekut.

1935. a. töötas Eestis 141 sademetejaama. Nende vaatlusandmed on avaldatud käesolevas aastaraamatus koos 25 II-järgu meteoroloogiajaama andmetega. Sademete hulka mõõdeti igapäev kella 8 ajal tuulekaitsjatega varustatud sademetemõõtjatega, mille püüdepind on 500 sm². Kõik sademetemõõtjad asetsesid 2 meetri kõrgusel maapinnalt. Tabelites esinevad sademete kuu- ja aastasummad, kõige suurem ööpäevane hulk ja päevade arv sademetega. Lumepäevadeks on arvatud need päevad, mil on sadanud lund ning sademete koguhulk hommiku kella 8-st järgmise päeva kella 8-ni oli vähemalt 0,1 mm.

Äikese- ja rahevaatlusi toimetati 148 vaatluskohas. Tabelites on antud kõue ja rahesaju algus ning kõue- ja rahepäevade arv. Märk \square tähendab lähedat kõuet, \top — kauget kõuet ja \times — pälku. Äikese- või rahelahjude korral on vaatlusandmed trükitud rasvaselt. Tabelites leiduv punkt (.) tähendab, et vaatlusi ei ole toimetatud või nad on avaldamiseks puudulikud, kriips (—) aga, et vastavat nähtust ei ole olnud.

1935. 36. a. talvel toimetati lumevaatlusi 138 vaatluskohas. Lume kõrgust mõõdeti nagu eelmistelgi talvedel kell 8 hommikul. Vaatlustel tarvitati sentimeeterjaotustega mõõdupuud, mis asetatud tuule eest kaitstud tasasele kohale. Tabelites on antud dekaadide (10 päeva) keskmine lumekõrgus sentimeetrites. Null (0) tähendab, et dekaadi keskmine lumekõrgus oli alla 0,5 sm, kriips (—), et dekaadi kestel pole lumikatet olnud, punkt (.), et vaatlusi pole toimetatud.

Sademete-, äikese-, rahe- ja lumevaatluste jaoks on antud ühine vaatluskohtade nimestik tähestikulises järjestuses. Samuti on kõigis tabelites vaatluskohad järjestatud tähestiku järele.

Sisevete kinnikülmumise ja lahtimineku ajad leiduvad tabelis lk. 150. Kinnikülmumise ajaks loeti päev, mil vaadeldav veeala kattus kuitahes õhukese jääkorruga või, mil liikuv jää jäi seisma ning külmus kokku. Vete lahtimineku ajaks loeti päev, mil jääkate katkes või hakkas liikuma.

Lumi- ja jääkatte kestus on antud nende päevade kohta, mil lumi- või jääkate oli tõeliselt olemas. Kui sulade ilmade tõttu see vahepeal puudus ja hiljem uuesti ilmus, siis on kestus antud mitme arvuga, mis omavahel ühendatud pluss (+) märgiga.

Vaatlusjaamade ülesleidmise hõlbustamiseks on aastaraamatu lõppu paigutatud kaart „Eesti meteoroloogiajaamad“.

Vaatlusandmeid töötasid ümber observatooriumi ametnikud T. Raielo ja H. Lokko, kuna andmete kontrolli teostasid observatooriumi inspektor A. Kärnsa ja allakirjutanu.

K. Kirde.

Met. Observatooriumi juhataja.

Notes on Precipitations, Thunderstorms, and Height of Snow Layer.

The observations of precipitations, thunderstorms, and height of snow layer were made at 170 observation points, comprising stations of 2-nd order and other special observation points. The freezing and the opening of the inland waters were also observed at some of these stations.

Precipitations were observed at 141 stations in 1935; besides these, the observations of 25 stations of 2-nd order have also been included in this year-book. The precipitations were measured every morning at 8 o'clock by means of a rain-gauge of 500 cm² receiving surface protected by funnel-shaped Nipher type shields.

All the rain-gauges were placed at a height of 2 m above the ground. The tables contain the monthly and yearly amounts of precipitations in mm, the maximal daily amounts, and the number of days on which rain fell.

Days with snow-fall on which the daily amount of precipitations from 8 till 8 o'clock was at least 0.1 mm are reckoned as days with snow-fall.

The observations of thunderstorms and hail-fall were made at 148 observation points. The tables show the beginning of thunderstorms and of hail-fall and the number of days on which they were observed. The sign ⚡ denotes a thunderstorm in the neighbourhood, T — thunder, and ⚡ — heat-lightning. Cases of damage produced by lightning or hail, are printed fat. A dot (.) denotes either that the observation was not made or that it was unreliable, a dash (—) — an absence of the corresponding phenomenon.

The height of snow layer was measured at 138 observation points. The observations were made at eight o'clock every morning

by means of a pole divided into cm in a level place protected from the wind. The tables contain the average height of snow layer for each decade; (0) denotes, that the average height of snow layer was less than 0.5 cm, a dash (—) — an absence of snow layer during the decade, and a dot (.) — an absence of observation. In all the tables the stations are ordered alphabetically.

The freezing and opening of the inland waters are given on page 150. A day when the observed water surface was covered with ice, be it ever so thin, or when the floating ice began to solidify, is considered as the beginning of solid ice-cover. The day on which the ice cover began to move or some openings were formed in it, is considered as a day on which the opening of the water began.

If the snow layer or the ice cover was intermitted by thawing weather, the durations of separate periods are expressed by corresponding figures joined by the sign of +.

In order to present a better survey a map with all the observation points is given at the end.

K. Kirde.

Director of the Meteorological Observatory.
